TensorFlow may give types of "Module Not Found" errors if TensorFlow is not installed correctly.

In that case we have to remove and reinstall TensorFlow and Keras as Administrator using Python Package Installer (PIP). Please follow these steps.

STEP1: Close Spyder and any open Anaconda Navigator window.

STEP2: Then open Anaconda prompt and uninstall both keras and tensorflow

```
conda uninstall keras
```

and

```
conda uninstall tensorflow
```

STEP3: Then close the anaconda prompt.

STEP4: Then once again go to start >> anaconda prompt **(Right click and select "Run as Administrator")**

STEP5: Then run the commands to install TensorFlow and Keras using pip in the following order

```
pip install tensorflow
```

and then

```
pip install keras
```

STEP6: Then open Spyder and check if the same issue persists
